

Multiplication/Division

6 – Facts

This packet can help you learn these multiplication facts and the division facts (on the back) that go with them.

Contents:

Instruction:

- Coach's Notes
- 6 Facts: More Strategy tips
- 6 Facts: Fact Families
- 6,7,8,9,10: Using your Hands to Multiply

Games:

- Flashcard Maze (Mult or Div)
- Capture the Box (Mult)
- Great Turtle Race (Mult)
- Great Turtle Race (Div)
- Race or Bump (Mult)
- Bingo (Div)
- Fact Family Steal! (both)
- Trade the Trash/Concentration (both or either)

Flash Cards:

- 6-Fact Multiplication
- 6-Fact Division

X	0	1	2	3	4	5	6	7	8	9	10
0	0	0	0	0	0	0	0	0	0	0	0

Coach's Notes

These fact packets are meant to be a part of the “Personal Best” fact fluency program, so be sure to read the information about how that program is meant to work.

Philosophy

These packets are based on the philosophy that it is helpful for students to understand the commutative property ($2 \times 3 = 3 \times 2$) from the very beginning and also to understand the close relationship between multiplication and division from the very beginning. So, the multiplication and division facts are all included.

Daily routine:

It is helpful to have a daily routine for Fluency Practice. Here is what I suggest:

Pick a set of target facts. If the student is ready, you can work on all the facts in the packet at once. If that is overwhelming, feel free to work on either multiplication or division separately, or to pick out a few fact families to work on at a time – but pick a set of target facts to work on each day, with the goal of working on all of them eventually.

Then every day:

1. Have the students write the target facts on their white boards at least once from memory ($3 \times 1 = 3$, $3 \times 2 = 6$, $3 \times 3 = 9$, etc.) as a warm-up.
2. Shuffle the flashcards for your target facts and run through them once, having the student place them in two stacks – 1 stack of cards they have mastered, and 1 stack that either they get wrong or take a long time to figure out. Practice the second stack a couple of extra times.

Once you have done that, you can go over some of the instructional material if needed or play a review game.

Note: You may not have time to play a game every day, but I would at least try to do steps 1 and 2 every day. Maybe play a game every Friday or every other day. Research shows that a little practice on facts every day is more effective than trying to do a whole lot at once.

Strategy tips for 6s

One way some people remember 6s is to “triple then double.” Since $6 = 3 \times 2$, you can multiply by 3 and then multiply your answer by 2 (or add it to itself). For example:

If you are trying to figure out $6 \times 4 = 24$

- Triple first: $3 \times 4 = 12$
- Then double: $12 + 12 = 24$

If you are trying to figure out $6 \times 7 = 42$

- Triple first: $3 \times 7 = 21$
- Then double: $21 + 21 = 42$

If you are trying to figure out 6×8

- Triple first: $3 \times 8 = 24$
- Then double: $24 + 24 = 48$

Six Sense

*Six is pretty quick to do,
just multiply by 3 then 2.
If this sounds like too much trouble,
triple first before you double!*

--- by Greg Tang

3X facts, 6X facts and 9X facts are all related – so once you know one set of facts it can help you remember the rest.

3X	6X = 3X + 3X	9X = 3X + 3X + 3X
$3 \times 2 = 6$	$6 \times 2 = (3 \times 2) + (3 \times 2) = 12$ $6 \times 2 = 6 + 6 = 12$	$9 \times 2 = (3 \times 2) + (3 \times 2) + (3 \times 2) = 18$ $9 \times 2 = 6 + 6 + 6 = 18$

6 Facts: Fact Families

The 6X facts and the $\div 6$ facts have a relationship to each other, Because of this relationship, we sometimes say they are in the same "fact family." Sometimes you will see this relationship explained as a "number bond," like in the picture to the right (\rightarrow).

If you understand about fact families and number bonds, you can figure out four different math facts (two multiplication facts and two division facts) if you only know one!

Here's how it works. Let's say you are trying to solve the division problem $18 \div 6 = ?$

You already know the multiplication fact " $6 \times 3 = 18$," so you can **think of the Fact Family** and ask yourself, "6 times WHAT equals 18?" You already know the answer to that! It's 3!

Number Bond

Fact Family

$6 \times 3 = 18$	$3 \times 6 = 18$
$18 \div 6 = 3$	$18 \div 3 = 6$

Use your knowledge of the relationship between multiplication and division to complete these number bonds and then complete the fact families that go with them.

Try these problems. If you don't know an answer, try using your knowledge of fact families to figure it out.

$$6 \times 8 =$$

$$48 \div 6 =$$

$$48 \div 8 =$$

$$7 \times 6 =$$

$$42 \div 6 =$$

$$42 \div 7 =$$

6,7,8,9,10: Using your hands to Multiply

Sometimes it is tough to remember the multiplication facts for 6 – 10. Here's a handy strategy to help if you get stuck.

Hold your hands in front of you with the fingers pointing towards each other and the thumbs pointing up.

Give each finger on each hand a number starting with 6 for the thumbs and going to 10 for the pinkies.

Touch the fingers together for the two numbers you want to multiply. For this example, we are multiplying 8 X 7.

Imagine there is a line running through the two fingers that are touching. Count the two fingers on the line and all the fingers above it. This will give you the tens for your product. In this example there are 5 fingers on the line or above it, so the product will be in the 50s.

Count the fingers below the "line" on each hand – and multiply those two numbers together. In this example there are 2 on one hand and 3 on the other, so $2 \times 3 = 6$. That is the ones digit of your product. So, your answer is 50 + 6. $8 \times 7 = 56$

Here are some practice problems for some of the larger multiplication facts. If you don't remember the answers, try using your hands!

$$6 \times 7 =$$

$$6 \times 9 =$$

$$6 \times 8 =$$

$$7 \times 6 =$$

$$9 \times 6 =$$

$$8 \times 6 =$$

Flashcard Maze (Multiplication/Division)

Materials needed:

- Flashcards (You can play with just multiplication, just division, or mixed)
- 6-sided die
- Game pieces

Prep:

Lay out the flashcards in a maze, face down.

To Play:

Take turns rolling the dice and moving that number of spaces on the maze. When you land on a card, turn it over and answer the problem. If you get it correct, you get to stay in that place. If not, you have to go back to where you were before you rolled.

If you land on a card that has already been turned over, you must say a problem that is in the same fact family. For example, if you land on "6 X 3," but it has already been answered. You can say "6 X 3 = 18, so 18 ÷ 6 = 3."

If you land on a card where the answer is 0, move 2 spaces back (but do not turn over that card).

If you land on a card where the answer is a multiple of 10 (10, 20, 30, 40, etc.) move 2 extra spaces forward (but do not turn over that card).

To win:

First player to complete the maze wins.

Lay out the flashcards (as many as you want) in a maze pattern.

Start

End

Capture the Box

6 Multiplication Facts

Materials needed:

- Capture the box gameboard
- 10-sided dice
- Different colored dry-erase marker for each player

To Play:

Player 1 rolls the 10-sided die (0 counts as 10) and multiplies his roll by 6 and says the problem and answer out loud ($6 \times 3 = 18$) to get one of the numbers on the board. He then draws a line on one side of the box that contains that number.

If the player's line completes a box, that means he captures it and gets to put his initials in it. If the line completes two boxes, the player captures/initials both boxes.

If there are no lines you can draw with your roll, you lose your turn and the next player rolls.

To win:

Play until all boxes have been captured, the player who captured the most boxes wins. (Or you can set a timer and play till time runs out.)

The Great Turtle Race – 6 Multiplication Facts

Materials Needed:

- Turtle Race game boards
- 6-sided die
- Dry erase boards/Markers/Erasers
- 6 “Turtles” (game counters) per player

To play:

Each Player puts a turtle (game counter) in the first space of each “lane” on his/her racing card.

Player 1 rolls the die and answers the math problem in the next available space in the lane with the number corresponding to the roll of the dice. If the answer is correct, move the turtle for that lane one space forward. Then it is player 2’s turn.

AS ALWAYS: Any player who rolls the dice off the table loses a turn.

To win: First player to get 3 turtles across the finish line wins.

The Great Turtle Race

1	6 X 5	6 X 2	6 X 4	6 X 3	6 X 1	6 X 8	Finish!	
2	6 X 9	6 X 6	6 X 7	6 X 10	6 X 8	6 X 1	Finish!	
3	6 X 6	6 X 9	6 X 10	6 X 7	6 X 3	6 X 4	Finish!	
4	6 X 2	6 X 5	6 X 3	6 X 9	6 X 1	6 X 8	Finish!	
5	6 X 5	6 X 4	6 X 2	6 X 7	6 X 10	6 X 6	Finish!	
6	6 X 4	6 X 5	6 X 8	6 X 6	6 X 10	6 X 2	Finish!	

The Great Turtle Race – 6 Division Facts

Materials Needed:

- Turtle Race game boards
- 6-sided die
- Dry erase boards/Markers/Erasers
- 6 “Turtles” (game counters) per player

To play:

Each Player puts a turtle (game counter) in the first space of each “lane” on his/her racing card.

Player 1 rolls the die and answers the math problem in the next available space in the lane with the number corresponding to the roll of the dice. If the answer is correct, move the turtle for that lane one space forward. Then it is player 2’s turn.

AS ALWAYS: Any player who rolls the dice off the table loses a turn.

To win: First player to get 3 turtles across the finish line wins.

Multiplication Race or Bump – 6's

Materials needed:

- 10-sided die (0 counts as 10)
- 10 game counters per player (a different color for each player)

To play Race:

Object of the game is to be the first person to get all the numbers on the game board. Player 1 rolls the die and multiplies the number on the die X 6. He places his counter next to the answer. Player 2 takes a turn and does the same and so on. If a player gets a number he already has covered, it's the next player's turn. The first player to get all the numbers wins.

To play Bump:

Object of the game is to cover more spaces on the board than the other player. Player 1 rolls the die and multiplies the number on the die X 6. He covers the answer with one of his game counters. Player 2 rolls and does likewise. If a player gets a number that is already covered by the other player's game counter, he "bumps" that counter off and replaces with his counter. The player with the most counters on the board when all the numbers are covered wins.

Multiplication Bingo

Materials needed:

- Set of Multiplication Flash Cards - Well shuffled.
- Dry erase markers/erasers
- Chips or game counters (optional)

To Play:

Players take turns drawing a flashcard and answering the problem. Once the problem is answered correctly, all players can mark out the corresponding number on their bingo cards. If you run out of cards before someone “bingos” – just reshuffle the cards and keep going.

To win:

First player with 5 in a row in any direction (down, across, diagonal) wins.

Multiplication Bingo

DIVISION FACTS

Division Bingo

Materials needed:

- Set of Multiplication Flash Cards - Well shuffled.
- Dry erase markers/erasers
- Chips or game counters (optional)

To Play:

Players take turns drawing a flashcard and answering the problem. Once the problem is answered correctly, all players can mark out the corresponding number on their bingo cards. If you run out of cards before someone “bingos” – just reshuffle the cards and keep going.

To win:

First player with 5 in a row in any direction (down, across, diagonal) wins.

Division Bingo

Materials needed:

- Set of Multiplication Flash Cards - Well shuffled.
- Dry erase markers/erasers
- Chips or game counters (optional)

To Play:

Players take turns drawing a flashcard and answering the problem. Once the problem is answered correctly, all players can mark out the corresponding number on their bingo cards. If you run out of cards before someone “bingos” – just reshuffle the cards and keep going.

To win:

First player with 5 in a row in any direction (down, across, diagonal) wins.

Fact Family Steal

Materials needed:

- Multiplication and Division flashcards for the same fact family (for example, all the X2 and $\div 2$ flashcards)
- 10 Steal Cards (Be sure to count to make sure you have 10)

Object of the Game: To collect two “books.” A “book” is a set with all the multiplication and division facts in the same Fact Family (two multiplication facts and two division facts). For example: 3×2 , 2×3 , $6 \div 2$, $6 \div 3$.

To play: Shuffle the flash cards and the STEAL! Cards together thoroughly. Put them in a stack face down where everyone can reach them. This is the draw pile.

Players take turns drawing a card and answering the problem by saying the problem and the answer out loud (For example, “ $3 \times 2 = 6$ ”). Once a player has answered a problem correctly, he/she can add it to his/her collection of cards. Cards must be displayed face up where everyone can see them. The rest of the players do the same.

Players continue drawing cards, answering the problems, and placing them face up – grouping them into fact families where appropriate. Once a player gets a complete family, those cards are protected and cannot be stolen.

If a player draws a “STEAL!” card, that player can steal one card from any other player. Once you have used a STEAL! Card, place it in a stack next to the draw pile. If you draw a “STEAL!” card, but there is nothing to steal (for example the first card of the game), place it in the stack next to the draw pile and draw another card. Players cannot save STEAL! Cards. You must use them when you get them.

To win: First player to get two complete books wins. If you run out of cards before one player wins, you can play “sudden death” by having the players take turns stealing from each other until a player gets two complete books.

Trade the Trash

Materials needed:

- Flash cards (Multiplication, Division or both)
- Answer cards - make sure you have a correct answer card for each flash card you are using.
- Trade the Trash Cards – You will need one Trade the Trash card for every 3 or 4 flash cards you are using.

The object of the game is to collect matching pairs of cards – the math problem and the correct answer (for example $6 \div 2$, and 3). The first player to make 4 pairs is the winner.

Make sure you have the answer card for each flash card. Shuffle the flash cards, answer cards and the Trade the Trash cards together thoroughly. Place them in a stack face down where all players can reach them. This is the draw stack.

Players take turns either drawing or trading cards, and making pairs. You can do 1 of these two things when it is your turn – but not both.

- Draw – Player takes the top card from the draw stack and makes any possible pair with the cards they already have. If the player draws a “Trade the Trash” card, they can save that to use at a later time.
- Trade – if a player has a “Trade the Trash” card, they can use their turn to trade a card they don’t need for a card they do need from another player. (The other player does not have a choice in the matter.) Place used “Trade the Trash” cards in a pile next to the Draw pile.

Once a pair is made, those cards are protected and cannot be traded. **First player to make 4 pairs wins.**

Players must display all the cards they have available for trading so everyone can see them. If a player has more than one “Trade the Trash” card they can trade extras for other cards they need.

Concentration

Materials needed:

- 10 sets of flashcards and their matching answer cards (20 cards in all)

Lay the cards out in a 4 X 5 array (See picture to the right).

Players take turns turning over two cards. If the cards “match” – the correct problem and the correct answer -- then the player keeps the two cards and tries again. If they do not match, the player turns them back over, and it is the next player’s turn. Play until all cards are matched. Player with the most matches wins.
